

# Moles & Mass

## Outcome:

Solve problems requiring inter-conversions between moles, mass, volume, and number of particles.

# Moles & Mass

Recall that the **MOLAR MASS** of a substance is how many **GRAMS** one **MOLE** will **WEIGH**.

We can calculate the moles of a known substance given its mass, and vice versa using the molar mass.

We can think of molar mass as a **CONVERSION** factor.

Ex. The molar mass of carbon is 12 g/mol, which means it takes 12g of carbon to have a mole ( $6.02 \times 10^{23}$  atoms)

*24 g of carbon would contain 2 moles 3 moles of carbon would weigh 36 grams*

# Moles & Mass

Instead of memorizing formulas, we can use units to help us do calculations...

Ex)

$$12 \text{ g/mol} \rightarrow \frac{12 \text{ g}}{1 \text{ mol}} \quad \text{or} \quad \frac{1 \text{ mol}}{12 \text{ g}}$$

$$\cancel{\text{mol}} \times \frac{\text{g}}{\cancel{\text{mol}}} = \text{g}$$

$$\text{g} \times \frac{\text{mol}}{\text{g}} = \text{mol}$$

# Moles & Mass

## Examples:

Calculate the number moles of  $\text{CO}_2$  in 6.4g.

**Step 1: find the molar mass of  $\text{CO}_2$**

$$12 + (2 \times 16) = 44 \text{ g/mol}$$

Two arrows point from the result to the following fractions:

$$\frac{44 \text{ g}}{1 \text{ mol}}$$
$$\frac{1 \text{ mol}}{44 \text{ g}}$$

**Step 2: find the moles of  $\text{CO}_2$**

$$6.4 \text{ g} \times \frac{1 \text{ mol}}{44 \text{ g}} = \boxed{0.145 \text{ mol}}$$

# Moles & Mass

## Examples:

Calculate the mass of 0.48 moles of silver nitrate.

**Step 1: find the molar mass of  $\text{AgNO}_3$**

$$107.9 + 14 + (3 \times 16) = 169.9 \text{ g/mol}$$

**Step 2: find the mass of  $\text{AgNO}_3$**

$$0.48 \text{ mol} \times \frac{169.9 \text{ g}}{1 \text{ mol}} = \boxed{81.55 \text{ g}}$$

# Moles & Mass

*Try this one...*

Calculate the mass of 2.5 moles of oxygen gas.  $\rightarrow O_2 = 32g/mol$

$$2.5 \text{ mol} \times \frac{32 \text{ g}}{1 \text{ mol}} = \boxed{80 \text{ g}}$$
