

# Density & Molar Volume

NHL Puck

Sponge Puck

## Outcome:

Calculate the volume of a given mass of a gaseous substance from its density at a given temperature and pressure. *Include Molar Volume*

# Density Review

$$D = \frac{m}{V}$$

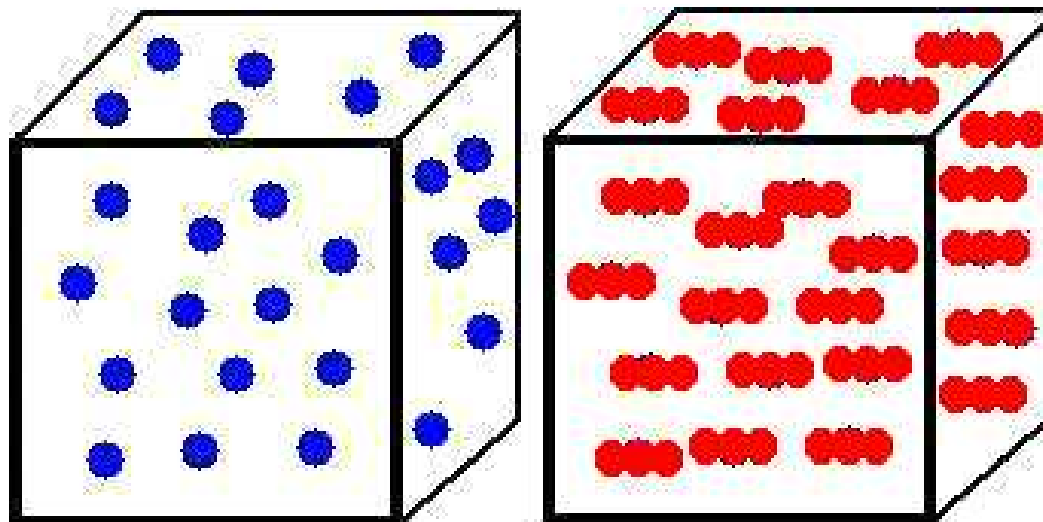

## Density:

- Is the **MASS** of a substance in a **SPECIFIC VOLUME** and can be measured in units like **g/L, g/mL, g/cm<sup>3</sup>**, etc.
- Is a characteristic **PHYSICAL PROPERTY** of different substances. (i.e. foam is less dense than rubber)

# Density Review

The **SAME VOLUMES** of different gases will have different **DENSITIES**, even with the same number of particles because of their **MOLAR MASSES**...

Helium, He MW = 4 g

D = 0.00018 g/L

Carbon Dioxide, CO<sub>2</sub> MW = 44 g

 D = 0.00197 g/L

Density varies with the type of molecule. With the number of molecules constant, the density varies with the molecular weight, MW. The higher the MW, the higher the density.

<http://chemistry.elmhurst.edu/vchembook/123Adensitygas.html>

# Density Review

We can think of density like a ratio (just like molar mass).

Ex) The density of aluminum is  $2.7\text{g}/\text{cm}^3$

$$\frac{2.7\text{g}}{1\text{cm}^3} \quad \text{OR} \quad \frac{1\text{cm}^3}{2.7\text{g}}$$

$$\text{cm}^3$$

# Density Calculations

## Examples:

1. If 10ml of water weighs 10g, what is the density of water?

$$\frac{10g}{10ml} = 1g/ml$$

g/ml

2. If a diamond has a density of 3.51g/cm<sup>3</sup>, what would be the mass of a 1cm<sup>3</sup> diamond?

$$1cm^3 \times \frac{3.51g}{1cm^3} = 3.51g$$

# Density Calculations

## Examples:

3. Copper has a density of 8.92g/cm<sup>3</sup>. What would be the volume occupied by 18g of copper?

$$18g \times \frac{1 \text{ cm}^3}{8.92 \text{ g}} = \underline{2.02 \text{ cm}^3}$$

# Molar Volume (MV)

Molar Volume is the **VOLUME** occupied by **1 MOLE** of a **GAS**.

At Standard Temperature and Pressure, (**STP**) (**0 °C, 101.3 kPa**)  
**1MOL** of a **GAS** occupies **22.4 L**. Therefore,

$$\frac{22.4 \text{ L}}{1 \text{ mol}} \quad \text{or} \quad \frac{1 \text{ mole}}{22.4 \text{ L}}$$

At STP only

<http://www.tutorvista.com/content/science/science-i/atoms-molecules/molecular-mass-mole.php>

At **ROOM TEMPERATURE** (**25°C**), **1 MOLE** of a **GAS** will occupy **24.4L**

# Molar Volume (MV)

If we know the volume occupied, we can calculate the number of moles present:

## Examples:

1. Calculate the number of moles of O<sub>2</sub> gas that occupies 67.2L at STP.

$$67.2 \text{ L} \times \frac{1 \text{ mol}}{22.4 \text{ L}} = 3 \text{ mol}$$

# Molar Volume (MV)

## Examples (con't):

2. Calculate the volume of 3.0 mol of O<sub>2</sub> gas at STP.

$$3.0 \text{ mol} \times \frac{22.4 \text{ L}}{1 \text{ mol}} = 67.2 \text{ L}$$

3. What is the mass of 1L of nitrogen gas at STP?

$$1 \cancel{\text{L}} \times \frac{1 \text{ mol}}{22.4 \cancel{\text{L}}} = 0.045 \text{ mol} \times \frac{28 \text{ g}}{1 \text{ mol}} = 1.26 \text{ g N}_2$$

→ N<sub>2</sub>

# Molar Volume (MV)

We can prove the molar volume of gases using their densities at STP...

Calculate the molar volume of hydrogen gas if its density is 0.08999 g/L at STP.

$\swarrow$  H<sub>2</sub>

$\text{L/mol}$

assume 1 L H<sub>2</sub>

$$\hookrightarrow 0.08999 \text{ g} \times \frac{1 \text{ mol}}{2.02 \text{ g}} = \text{span style="border: 1px solid black; padding: 2px;">0.0445 \text{ mol}}$$

$$\text{Molar Volume} = \frac{1 \text{ L}}{0.0445 \text{ mol}} = 22.47 \text{ L/mol}$$
